

VM-level Quality of Service

Tintri is the only storage provider that lets you guarantee (and protect) the performance of individual VMs. In the process we've eliminated the guesswork around Quality of Service. Here's how — in words and pictures — Tintri gives you **unmatched control** and **visibility of performance**.

1

Do you have a rogue VM that is sucking up IOPS?

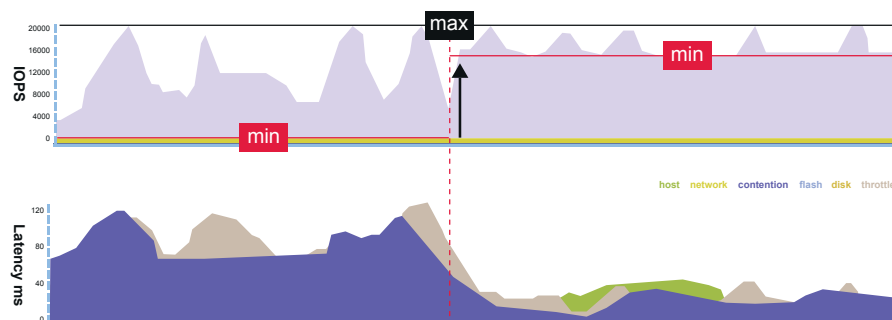

Simply drag the maximum toggle down to an acceptable level. Watch the “throttle” latency pop right away, but know that you've protected your other VMs from its bad behavior.

2

Do you have a mission critical VM with high performance demands?

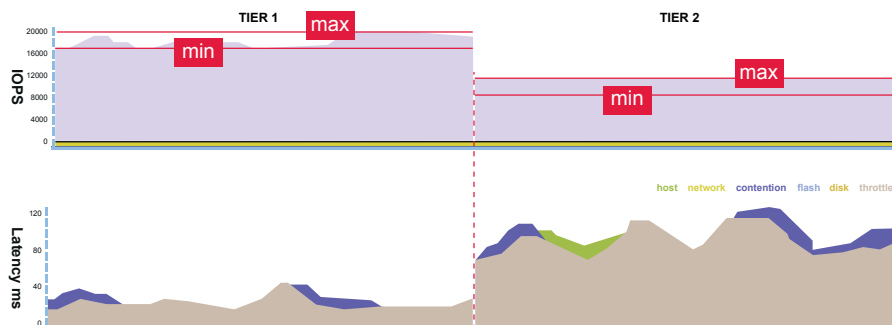

Tintri helps you visualize contention, so you can raise MIN IOPS to meet a VM's needs.

3

Do you need to establish tiers of service?

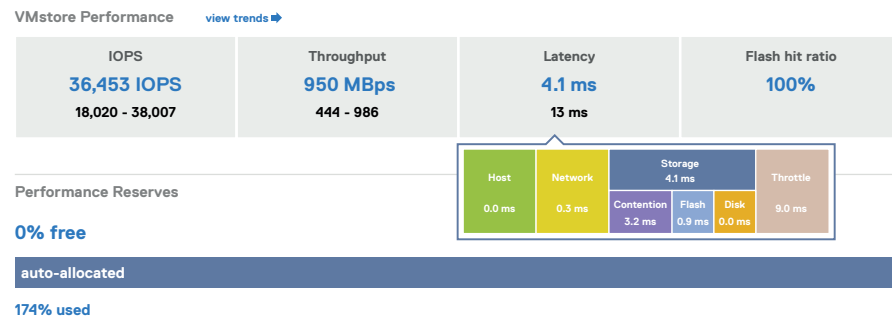

Whether you're setting guidelines for internal customers, or you're a service provider with a growing customer base, Tintri makes it easy to set service tiers and offer chargeback.

4

If there's latency... where does it come from?

Tintri lays the root cause of latency bare with one simple visual. We show you the source, across your entire infrastructure, so you can address it and move on.
